Same Physical Setup, Two Coherence Frames
F_{int}: Interference Frame
F_{wp}: Which-Path Frame
Detection probability (normalized)
Screen position
$\rho_{LR} \neq 0$
Coherence visible
Path L
Path R
Total (incoherent sum)
$\rho_{LR} = 0$
Paths definite
Slit L
Slit R
Born invariant: $\mu(L) = \mu(R) = \frac{1}{2}$ in both frames — frame-dependent: interference visibility, off-diagonal ρ_{LR}
